

Alfa Laval LeviMag™, Magnetic Mixer

Levitated Magnetic Mixer

Application

Alfa Laval LeviMag magnetic mixers offer effective mixing for multiple processes within Dairy, Beverage and Food applications - eg. aseptic or sterile storage or buffer tanks - where high demands on hygienic and aseptic design are required. Due to the compact design the LeviMag is also an obvious choice for low level agitation.

Depending on duty and media properties the LeviMag can be configured to be used in tanks from 30 l. to 40.000 l.

Working principle

A radial turbine installed inside the tank is rotated via the torque from a magnetic coupling. This creates mixing of the fluid inside the tank. The patented levitated design of the impeller makes the mixer fully drainable and able to run dry - hence it can mix to the last drop, securing maximum yield.

Unique features

Levitated design: Makes the bearing fully drainable and minimize wear of the bearing.

Replacable bearings: Both the female and the male bearing can be replaced by the end user on site.

High efficiency impeller: The impeller unit is flow optimized, which creates the possibility of gentle product treatment

Mixing to last drop: Dry running capability makes it possible to achieve maximum yield.

Available versions:

- Impeller with male/female bearing
- Impeller complete, with drive unit

Machine Selection:

LeviMag UltraPure can be sized and configured in Alfa Laval configurator.

Selection of size can also be done by use of the below selection charts.

Needed information for selection of size:

- Media Viscosity
- Tank Volume
- Tank diameter
- Duty (see below Duty Levels)

Duty Level	Duty	Description
1	Keep media homogenous	Keeping fluids homogenous & low gradient heat transfer
2	Mild blending	Simple blending of miscible fluids & high gradient heat transfer, no specific request to mixing time, create suspension if deposit velocity is below 0.015 m/s
3	Mixing	Mixing of fluids, relative low mixing time, create suspension if deposit velocity is below 0.03 m/s
4	Powerful mixing	Dissolving solids, very low mixing time, create suspension if deposit velocity is below 0.06 m/s.

Preconditions for using the selection charts:

- Liquid height must be equal to or lower than 2 times the tank diameter
- if duty involves suspension of particles (see deposit velocity limits in the duty levels), the tank diameter D must be:

$$D \leq \sqrt[3]{\frac{V \cdot 4}{\pi}}$$

where V is the net. Volume.

- If preconditions are not fulfilled please contact Alfa Laval Global Technical Support

How to select:

1. Select duty
2. Check preconditions
3. Go to the chart for the chosen duty
4. Read out the point for the requested tank volume (X-axis) and viscosity (Y-axis)
5. Choose the curve to the right from the point
6. If physically possible a larger impeller size can always be chosen - eg. to obtain a gentler product treatment (operating at lower speed)
